Task	6

Exercise 1: Creating product backlog items

Objective

In this exercise, you will practice creating epics, user stories, and tasks based on a set of requirements for creating a restaurant's website.

Task

Your task is to create the appropriate **epics, user stories, and tasks** to meet the following requirements for QaRestaurant's website:

- A logo needs to be designed for **QaRestaurant** using a leaf-based theme to show it is a vegan restaurant.
- The customer needs to view the logo in the navbar, the webpage tab, and in the footer.
- The customer needs to view social media links so that they can follow the restaurant on different platforms.
- The customer needs to view and switch between the following webpages:
 - **Our menu:** each item should have a title, description, and price.
 - **About us:** this should include what veganism is, a few pictures showing examples of vegan cuisine, and basic information about the head chefs.
 - **Order online:** customers need to be able to order items online.
 - **Reservations:** customers need to be able to place table reservations on the website. Customers can only place a reservation one month in advance and need to be able to view which tables are available for reservation.
 - **Contact us.**
- Customers need to visually see that the restaurant is located at "Anchorage 1, Anchorage Quay, Salford, The Quays, Manchester, M50 3YJ."
- Restaurant staff need to be able to both update and delete reservations if they receive a call from a customer.

As an example: "As a Customer, I want to view an about page, so that I can see information about the company"

Note: You will need to refer to the epics, user stories, and tasks that you created here when you reach exercise 2 and exercise 3.

Duration: 30 minutes

Exercise 2: Estimations

Objective

In this exercise you will work as a team to practice applying estimations to product backlog items. This simulates the process in the workplace.

Task

In teams, select someone to take the role of the **product owner** and use the epics, user stories, and tasks that they created in exercise 1.

As a team, you will play planning poker to assign story points to all product backlog items.

To play planning poker:

1. Take the first user story, for example, "**As a customer, I want to view an About us page, so that I can see information about the company,**" and assign it a story point value of **5**.
2. Once you have agreed on the story point estimation for one product backlog item, you can use this to estimate story points for the others. Think like this: "**if this is a 5, what would this next item be?**"

Duration: 15 minutes

Exercise 3: Using Jira

Objective

In this exercise you will practice using Jira to add product backlog items and start a sprint.

Task

Using your answers to exercise 1, your task is to create a new project in Jira and add:

- epics.
- user stories.
- tasks (If you have any).
- estimations using story points to every user story & task.
- prioritisations using MoSCoW.
 - You can use the description to describe this
 - You could also use labels
 - Ideally you add the “priority” option in project settings > issue types

Duration: 45 minutes
