

Objective of this exercise

Write code
Make changes
Check the code in

Detects the change
Raises a build event

Build and runs tests

In this lab, you will

- Deploy a web app from GitHub to CodePipeline
- Build and test the app
- Use EBS to deploy the app
- Make changes to your code and commit the changes to GitHub
- Set up the CodePipeline to detect the change and rebuild the app for EBS to deploy.

Create a Service role for your Elastic Bean Stalk service

Select Roles

- Dashboard
- Access management**
- User groups
- Users
- Roles**

☒ **AWS service**

Allow AWS services like EC2, Lambda, or others to perform actions in this account.

☐ **SAML 2.0 federation**

Allow users federated with SAML 2.0 from a corporate directory to perform actions in this account.

Use case

Allow an AWS service like EC2, Lambda, or others to perform actions in this account.

Service or use case

EC2

Choose a use case for the specified service.

Use case

☒ **EC2**

Allows EC2 instances to call AWS services on your behalf.

☐ **EC2 Role for AWS Systems Manager**

For the Permissions for the role add:

Bean			
Policy name ↗			
☐	+		AdministratorAccess-AWSElasticBeanstalk
☐	+		AWSElasticBeanstalkCustomPlatformforEC2Role
☒	+		AWSElasticBeanstalkEnhancedHealth
☒	+		AWSElasticBeanstalkManagedUpdatesCustomerRolePolicy

Type a name for the new Role and then click the **Create role** button.

Role details

Role name

Enter a meaningful name to identify this role.

Maximum 64 characters. Use alphanumeric and '+'

Create role

Create your BeanStalk application to upload your app

Type a name for your app (any name you like)

Application name

Get started

Easily deploy your web application in minutes.

Create application

Select Node.js for your platform for a sample app and then click the **Next** button

Platform [Info](#)

Platform type

☒ Managed platform

Platforms published and maintained by Amazon Elastic Beanstalk. [Learn more](#)

☐ Custom platform

Platforms created and owned by you. This option is unavailable if you have no platforms.

Platform

Node.js

Platform branch

Node.js 20 running on 64bit Amazon Linux 2023

Platform version

6.1.2 (Recommended)

Application code [Info](#)

☒ Sample application

☐ Existing version

Application versions that you have uploaded.

☐ Upload your code

Upload a source bundle from your computer or copy one from Amazon S3.

Deploy the sample NodeJS app using the AWS Elastic Beanstalk

Congratulations

Your first AWS Elastic Beanstalk Node.js application is now running on your own dedicated environment in the AWS Cloud

This environment is launched with Elastic Beanstalk Node.js Platform

What's Next?

Then start

CodePipeline ☆

Release Software using Continuous Delivery

Pipeline settings

Pipeline name

Enter the pipeline name. You cannot edit the pipeline name after it is created.

No more than 100 characters

Service role

New service role

Create a service role in your account

Existing service role

Choose an existing service role from your account

Role name

Type your service role name

Allow AWS CodePipeline to create a service role so it can be used with this new pipeline

Add source stage [Info](#)

Source

Source provider

This is where you stored your input artifacts for your pipeline. Choose the provider and then provide the connection details.

GitHub (Version 2) ▼

New GitHub version 2 (app-based) action

To add a GitHub version 2 action in CodePipeline, you create a connection, which uses GitHub Apps to access your repository. Use the options below to choose an existing connection or create a new one. [Learn more](#)

Connection

Choose an existing connection that you have already configured, or create a new one and then return to this task.

🔍 ✕

or

[Connect to GitHub](#)

Ready to connect

Your GitHub connection is ready for use.

Repository name

Choose a repository in your GitHub account.

🔍 ✕

<account>/<repository-name>

Branch name

Choose a branch of the repository.

🔍 ✕

Add deploy stage [Info](#)

You cannot skip this stage

Pipelines must have at least two stages. Your second stage must be either a build or deployment stage. Choose a provider for either the build stage or deployment stage.

Deploy

Deploy provider

Choose how you deploy to instances. Choose the provider, and then provide the configuration details for that provider.

▲

Q

AWS AppConfig
AWS CloudFormation
AWS CloudFormation Stack Set
AWS CodeDeploy
AWS Elastic Beanstalk
AWS OpsWorks Stacks
AWS S3PublishDev
AWS Service Catalog
Amazon ECS
Amazon ECS (Blue/Green)
Amazon S3
